

# OCTOPUS KIOSK

ADOBE XD LAYOUTS

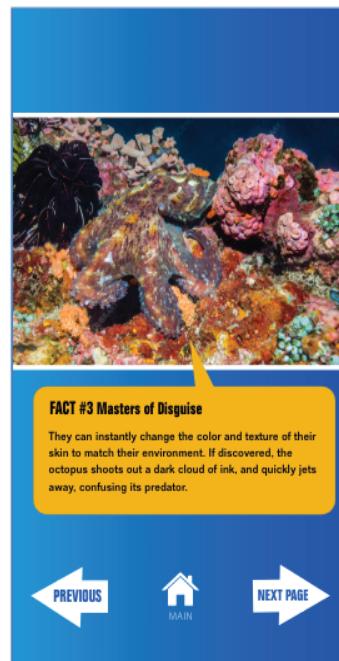

#### FACT #1

Octopuses are highly intelligent problem solvers, and quickly learn how to open screw top jars containing food, solve mazes, and distinguish between and memorize shapes (square, circle, triangle, star, etc.) used as visual training cues.

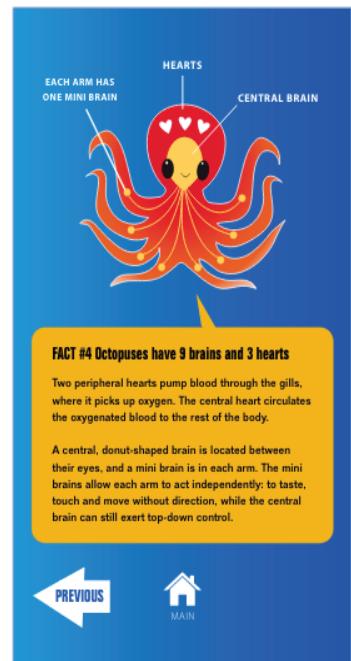

#### FACT #2

Except for a parrot-like beak, octopuses have no bones. This allows them to squeeze through holes and crevices much smaller than themselves: only the size of the beak restricts them.

#### FACT #3 Masters of Disguise

They can instantly change the color and texture of their skin to match their environment. If discovered, the octopus shoots out a dark cloud of ink, and quickly jets away, confusing its predator.

#### FACT #4 Octopuses have 9 brains and 3 hearts

Two peripheral hearts pump blood through the gills, where it picks up oxygen. The central heart circulates the oxygenated blood to the rest of the body.

A central, donut-shaped brain is located between their eyes, and a mini brain is in each arm. The mini brains allow each arm to act independently: to taste, touch and move without direction, while the central brain can still exert top-down control.
